Motivation

- ⇒ Solutions to many interesting flow problems may exhibit localized singular features:
- sharp transition layers
 - propagating steep fronts
 - pronounced spikes
- ⇒ Approximations of these problems present a challenging computational task
- ⇒ Uniform grid is not a practical option: high resolution is only needed where irregularities occur.
- ⇒ Improvements in accuracy and computational efficiency may be obtained by economically adapting the grid points to the numerical solution.

Some Basic Principles in Wavelet Analysis

- The information is organized in different scale levels
- The information at a certain level is obtained from the information at the previous coarser level and the addition of details ([wavelet coefficients](#)).
- Wavelet coefficients may be interpreted as local approximation errors: they are significant in the presence of strong gradients
- Wavelet coefficients can be used as local regularity indicators.

Main Objectives: Application to Evolution Problems

$$\frac{\partial \mathcal{U}}{\partial t} = L\mathcal{U}$$

$L(\mathcal{U}) \rightarrow$ differential operator acting on spatial variables.

Suppose that at time $t_n = n\Delta t$ an sparse representation $(\mathcal{M}^n, \mathcal{U}^n)$ for the approximate solution is given, in which \mathcal{U}^n is formed by the numerical solution discrete values associated to an adaptive mesh \mathcal{M}^n .

Next time step: $(\mathcal{M}^{n+1}, \mathcal{U}^{n+1})$

\Rightarrow Extension (refinement): $(\mathcal{M}^n, \mathcal{U}^n) \xrightarrow{\mathcal{E}} (\mathcal{M}^{n+}, \mathcal{U}^{n+})$

\Rightarrow Time evolution: $(\mathcal{M}^{n+}, \mathcal{U}^{n+}) \rightarrow (\mathcal{M}^{n+}, \check{\mathcal{U}}^{n+1})$.

\Rightarrow Truncation (coarsening): $(\mathcal{M}^{n+}, \check{\mathcal{U}}^{n+1}) \xrightarrow{\mathcal{T}_\epsilon} (\mathcal{M}^{n+1}, \mathcal{U}^{n+1})$.

Sparse point representation – SPR (Holmstrom - 1997)

⇒ **Motivation:** Create an adaptive finite difference strategy that combines:

- **simplicity**, **stability** and **accuracy** of **FD** methods
- **ability** of **wavelet** coefficients in the characterization of local regularity of functions

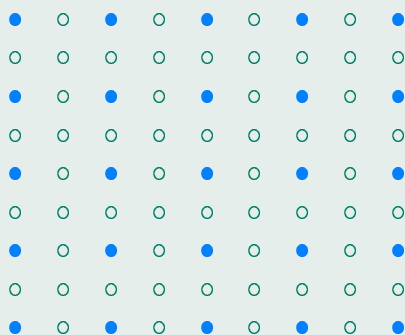

⇒ **Ideas:** Represent functions by the point values associated to their significant wavelet coefficients

- **coarse** grid in **smooth** regions, **fine** grid close to **irregularities**.
- at each point, **spatial derivatives** are discretized by **uniform FD** → step size proportional to the **point local scale**
- if a **stencil is not present** in the grid, it is **approximated** from coarser scales by an **interpolating subdivision scheme**.

[Homepage](#)[Página de Rosto](#)[Índice Geral](#)[<<](#)[>>](#)[<](#)[>](#)[Página 7 de 39](#)[Voltar](#)[Full Screen](#)[Fechar](#)[Desistir](#)

Hierarchical Uniform Grids

- The grids: $\mathcal{X}^\ell = \{(x_k^\ell, y_m^\ell) = (kh_x^\ell, mh_y^\ell) \in I \times I\}$
- $\mathcal{X}^\ell \subset \mathcal{X}^{\ell+1}$: $(x_k^\ell, y_m^\ell) \in \mathcal{X}^\ell \Rightarrow (x_{2k}^{\ell+1}, y_{2m}^{\ell+1}) \in \mathcal{X}^{\ell+1}$
- Points in $\mathcal{X}^{\ell+1}$

- \rightarrow points of \mathcal{X}^ℓ
- \rightarrow points of $\mathcal{X}^{\ell+1} \setminus \mathcal{X}^\ell$

Interpolatory Wavelet Coefficients

$$f_{k,m}^{\ell} = f(x_k^{\ell}, y_m^{\ell}) = f_{2k,2m}^{\ell+1}$$

wavelet coefficients: Interpolation errors

$$d_{k,m}^{(1)\ell} = f_{2k,2m+1}^{\ell+1} - \tilde{f}_{2k,2m+1}^{\ell+1}$$

$$d_{k,m}^{(2)\ell} = f_{2k+1,2m}^{\ell+1} - \tilde{f}_{2k+1,2m}^{\ell+1}$$

$$d_{k,m}^{(3)\ell} = f_{2k+1,2m+1}^{\ell+1} - \tilde{f}_{2k+1,2m+1}^{\ell+1}$$

differences between the values of f in $\mathcal{X}^{\ell+1} \setminus \mathcal{X}^{\ell}$ and the ones obtained by interpolation, using the values of f in \mathcal{X}^{ℓ}

○ ○ ○ ○

○ $d_{k,m}^{(1),\ell}$ ○ $d_{k,m}^{(3),\ell}$ ○ ○

○ $f_{k,m}^{\ell}$ ○ $d_{k,m}^{(2),\ell}$ ○ ○

○ → position of wavelets coefficients

Example: ABR for the spike function

$$f(x,y) = 3 \exp^{-2500.0((x-0.3)^2+(y-0.3)^2)} + sen(2\pi x) + sen(2\pi y)$$

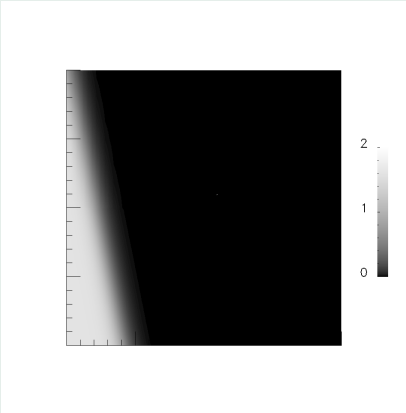

ϵ	$\#blocks$	$\#(\mathcal{M}_\epsilon)$	$\#(\mathcal{X}^\ell)$	$\#(\mathcal{M}_\epsilon)/\#(\mathcal{X}^\ell)$
10^{-5}	100	102400	2097152	0.05
10^{-4}	64	65536	262144	0.25
10^{-3}	28	28672	65536	0.43

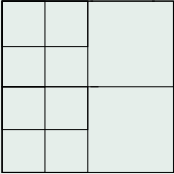

ABR for oblique-front function

$$f(x,y) = 1 - \tanh(25x + 5(y-1)),$$

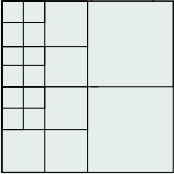

with abrupt changes close to the line $25x + 5(y-1) = 0$

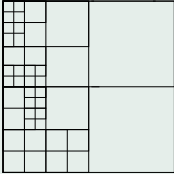

$\mathcal{M}_{10^{-3}}$

$\mathcal{M}_{10^{-4}}$

$\mathcal{M}_{10^{-5}}$

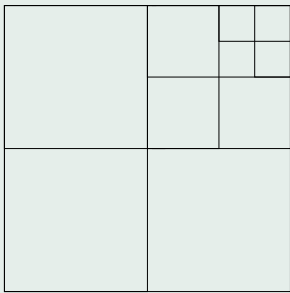

ϵ	# blocks	$\#(\mathcal{M}_\epsilon)$	$\#(\mathcal{X}^j)$	$\#(\mathcal{M}_\epsilon)/\#(\mathcal{X}^\ell)$
10^{-5}	44	45056	262144	0.17
10^{-4}	19	19456	65536	0.30
10^{-3}	10	10240	16384	0.60
10^{-2}	4	4096	4096	1.00

Operations on Block-Structured Grids

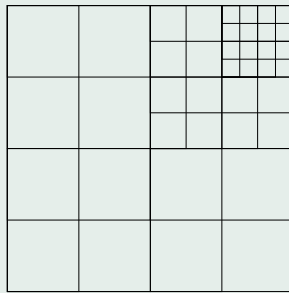

- Tree Extension ([Grid Refinement](#)) :

$$\mathcal{A} \xrightarrow{\mathcal{E}} \tilde{\mathcal{A}}$$

Grid \mathcal{M}

Grid $\tilde{\mathcal{M}}$

- Tree Reduction ([Grid Coarsening](#)):

$$\tilde{\mathcal{A}} \xrightarrow{\mathcal{T}_\epsilon} \mathcal{A}$$

[Homepage](#)[Página de Rosto](#)[Índice Geral](#)[◀◀](#)[▶▶](#)[◀](#)[▶](#)[Página 14 de 39](#)[Voltar](#)[Full Screen](#)[Fechar](#)[Desistir](#)

- **Functional Operations**

Operations between two functions represented in block-structured grids are straightforward point-wise evaluations if their grids coincide.

Otherwise, extend both grids in order to get representations in a common grid.

- **Differentiation**

The idea is to use finite difference operators with uniform spacing in each block.

To avoid demanding search procedures, the process of block construction should consider the addition of needed extra rows and columns around the block boundaries (ghost points).

[Homepage](#)[Página de Rosto](#)[Índice Geral](#)[◀◀](#)[▶▶](#)[◀](#)[▶](#)[Página 15 de 39](#)[Voltar](#)[Full Screen](#)[Fechar](#)[Desistir](#)

Examples: Advection Equation

$$\frac{\partial \mathcal{U}}{\partial t} + \left(\frac{\partial \mathcal{U}}{\partial x} + \frac{\partial \mathcal{U}}{\partial y} \right) = 0,$$

for $t \geq 0$, $(x, y) \in (0, 1) \times (0, 1)$, with periodic boundary condition and initial condition:

$$\mathcal{U}(x, y, 0) = \exp^{-300((x-0.5)^2 + (y-0.5)^2)} + 0.2 \sin(2\pi x) + \sin(2\pi y)$$

Exact solution: spike moving along the diagonal $x = y$, without changing its format.

Parameters

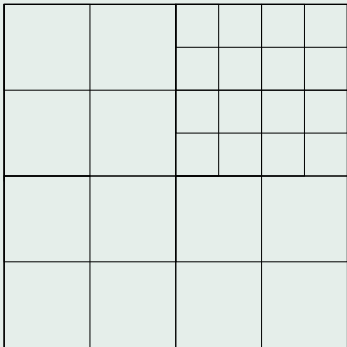

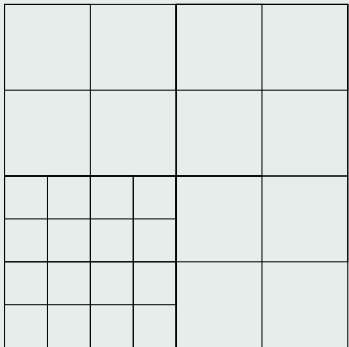

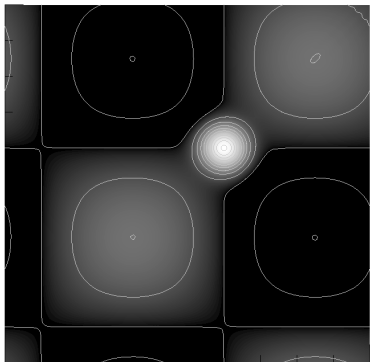

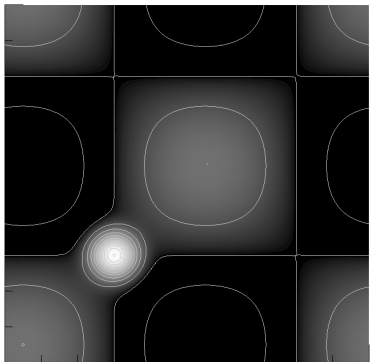

- $\epsilon = 10^{-3}$, $N_x = N_y = 32$ and $\lambda = h_{\min}^n / \Delta t^n = 5 \times 10^{-2}$
- interpolation, finite differences and Runge-Kutta \rightarrow 4-th order

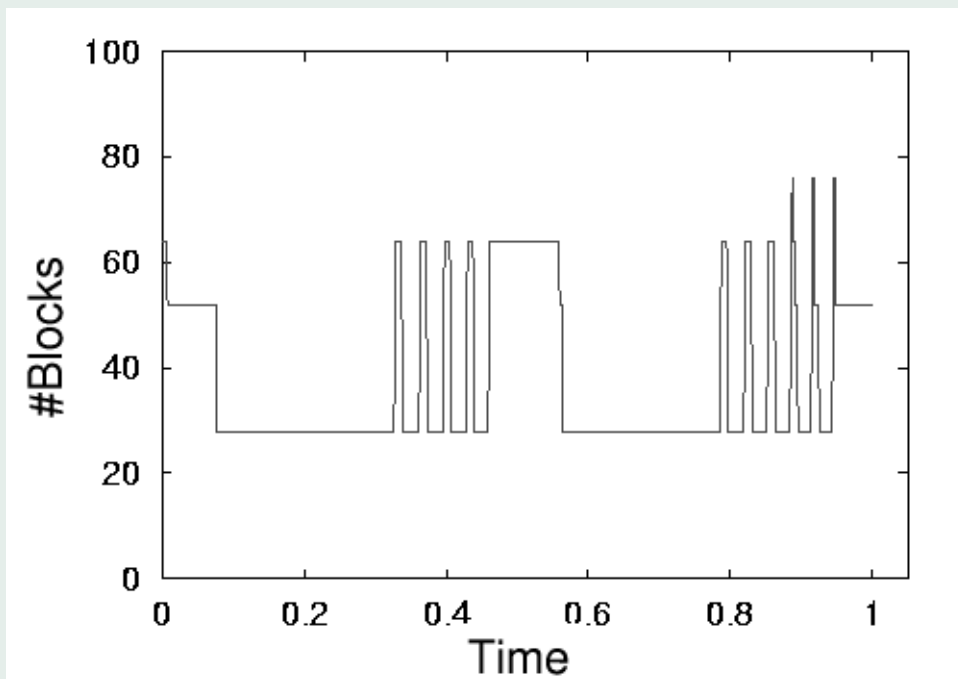

[Homepage](#)[Página de Rosto](#)[Índice Geral](#)[<<](#)[>>](#)[<](#)[>](#)[Página 16 de 39](#)[Voltar](#)[Full Screen](#)[Fechar](#)[Desistir](#)

Oblique Front: Advection-diffusion equation

$$\frac{\partial \mathcal{U}}{\partial t} + \frac{\partial \mathcal{U}}{\partial x} + \frac{\partial \mathcal{U}}{\partial y} - \frac{\partial^2 \mathcal{U}}{\partial x^2} - \frac{\partial^2 \mathcal{U}}{\partial y^2} = \mathbf{F}$$

$t \geq 0$, $(x, y) \in (0, 1) \times (0, 1)$ with appropriate boundary conditions and the forcing term.

Exact solution $\mathcal{U} = 1 - \tanh\left(25(x - t) + 5(y - 1)\right)$, describing a propagating steep front moving to the right.

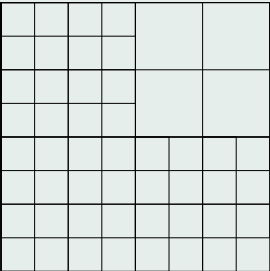

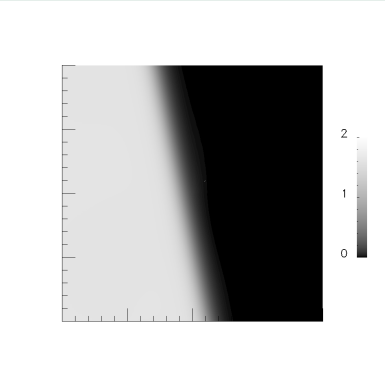

Parameters

$$\epsilon = 10^{-2}, N_x = N_y = 16 \text{ and } \lambda = 10^{-3}$$

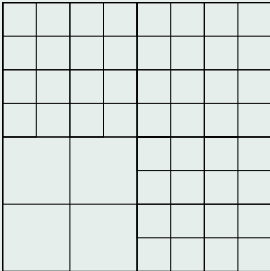

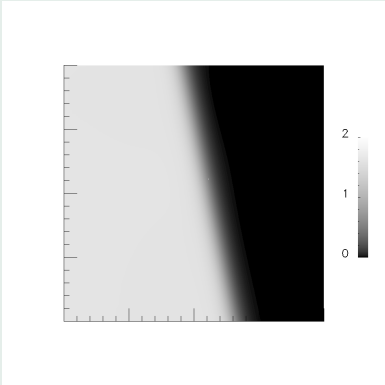

[Homepage](#)[Página de Rosto](#)[Índice Geral](#)[<<](#)[>>](#)[<](#)[>](#)[Página 19 de 39](#)[Voltar](#)[Full Screen](#)[Fechar](#)[Desistir](#)

Propagation of Oblique front

Sharp Transition Layers: Burgers' equation:

$$\frac{\partial \mathcal{U}}{\partial t} + \mathcal{U} \frac{\partial \mathcal{U}}{\partial x} + \mathcal{U} \frac{\partial \mathcal{U}}{\partial y} - \mu \frac{\partial^2 \mathcal{U}}{\partial x^2} - \mu \frac{\partial^2 \mathcal{U}}{\partial y^2} = 0,$$

$t \geq 0$, $(x, y) \in [0, 1] \times [0, 1]$, with periodic boundary conditions and initial data

$$\mathcal{U}(x, y, 0) = \text{sen}(2\pi x) \text{sen}(2\pi y).$$

negative and positive features move on opposite directions, producing sharp transition layers, as time evolves.

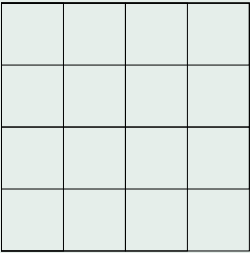

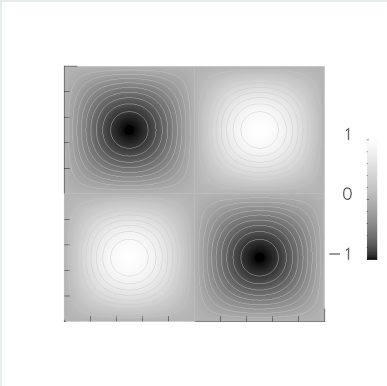

Parameters

$$\mu = 10^{-2}, \epsilon = 10^{-5}, N_x = N_y = 32 \text{ and } \lambda = 5 \times 10^{-2}$$

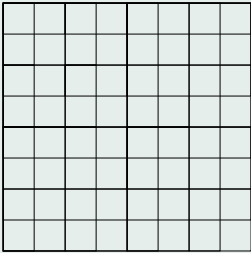

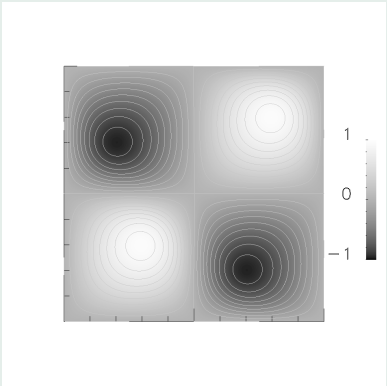

[Homepage](#)[Página de Rosto](#)[Índice Geral](#)[<<](#)[>>](#)[<](#)[>](#)[Página 22 de 39](#)[Voltar](#)[Full Screen](#)[Fechar](#)[Desistir](#)

Conclusion

- ⇒ An adaptive finite-difference scheme for PDEs based on block-structured grids, which are dynamically generated by wavelet representation techniques.
- ⇒ Algorithms and data structure are formulated by using abstract concepts borrowed from quad trees.
- ⇒ Given any desired accuracy, the method is intended to produce simulations with automatic grid refinement, as required by the numerical solution, without penalizing the computational complexity.
- ⇒ The method, as stated, faces the typical dilemma of adaptive solvers with explicit time discretization. Since, for stability, Δt is adjusted to the current finest scale level, the effect of any grid refinement is the increment of the total number of time steps.

Conservation Laws

$$\frac{\partial \mathbf{u}}{\partial t}(t, x) + \nabla \cdot \mathbf{f}(\mathbf{u}(t, x)) = 0 \quad \mathbf{x} \in \Omega \subset R^d, \quad t > 0$$

$\mathbf{u}(t, \mathbf{x}) = (u_1(t, \mathbf{x}), \dots, u_m(t, \mathbf{x}))$, conserved quantities

$\mathbf{f}(\mathbf{u}) = (f_1(\mathbf{u}), \dots, f_d(\mathbf{u}))$, flux function

Initial condition: $\mathbf{u}(0, x) = \mathbf{u}_0(x)$, $x \in \Omega$ + appropriate boundary conditions

[Homepage](#)[Página de Rosto](#)[Índice Geral](#)[<<](#)[>>](#)[<](#)[>](#)[Página 27 de 39](#)[Voltar](#)[Full Screen](#)[Fechar](#)[Desistir](#)

Discontinuous Galerkin Method

- Approximating space

$M_h \rightarrow$ partition of Ω ; $C \in M_h \rightarrow$ computational cells

$V_h \rightarrow$ space of piecewise polynomials of fixed degree $p \geq 0$

$$w \in V_h \Rightarrow w|_C \in \Pi_p$$

$B_{V_h} = \{\varphi_i(\mathbf{x}), \quad i = 1, 2, \dots, N\}$ basis spanning V_h

- Approximate solution

$$\mathbf{u}(t, \mathbf{x}) = \sum_{i=1}^N \mathbf{u}_i(t) \varphi_i(\mathbf{x})$$

[Homepage](#)[Página de Rosto](#)[Índice Geral](#)[<<](#)[>>](#)[<](#)[>](#)[Página 28 de 39](#)[Voltar](#)[Full Screen](#)[Fechar](#)[Desistir](#)

- **Galerkin Formulation**: Find $\mathbf{u} \in V_h$ such that $\forall \varphi_j$ and C

$$\frac{\partial}{\partial t} \int_C \varphi_j \mathbf{u} - \int_C \nabla \varphi_j \cdot \mathbf{f}(\mathbf{u}) + \int_{\partial C} \varphi_j \hat{\mathbf{f}}(\mathbf{u}) \cdot \tilde{\eta} = 0$$

$\hat{\mathbf{f}}(u) \rightarrow$ numerical flux

- **Time discretization + stabilization**

Runge-Kutta + slope limiters (Cockburn and Shu)

very small time-steps ($CFL < 1/(p+1)$)

slope limiters depend on the geometry and p

Runge-Kutta + SUPG diffusive term

does not work

Implicit Euler scheme + SUPG diffusive term

stability does not depend on p

[Homepage](#)

[Fechar](#)
[Desistir](#)

- Implicit time discretization + SUPG diffusive term

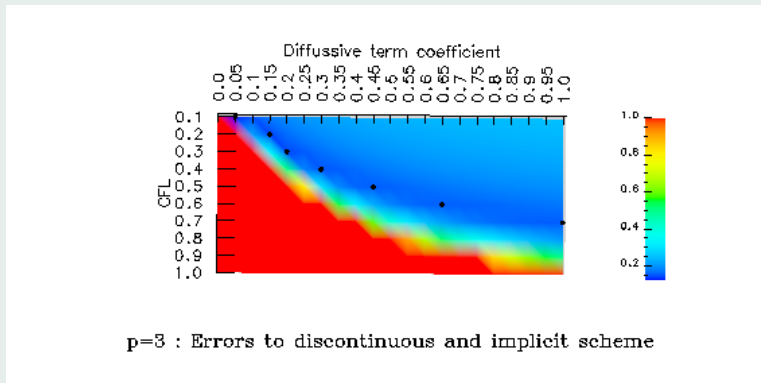

$$\sum_{i=1}^N \mathbf{u}_i^{n+1} \int_C \left[\varphi_i \varphi_j - \delta \Delta t_n (\nabla \varphi_j \cdot \beta) \sum_{s=1}^d f'_s(\mathbf{u}^{n+1}) \frac{\partial}{\partial \mathbf{x}_s} \varphi_i \right] = \int_C \mathbf{u}^n \varphi_j + \Delta t_n \left\{ \int_C \nabla \varphi_j \cdot \mathbf{f}(\mathbf{u}^n) - \int_{\partial C} \varphi_j \hat{\mathbf{f}}(\mathbf{u}^n) \cdot \boldsymbol{\eta}_C \right\}.$$

Diffusive coefficient: δ ; $\beta = (\beta_1, \beta_2)$ (Bonhaus)

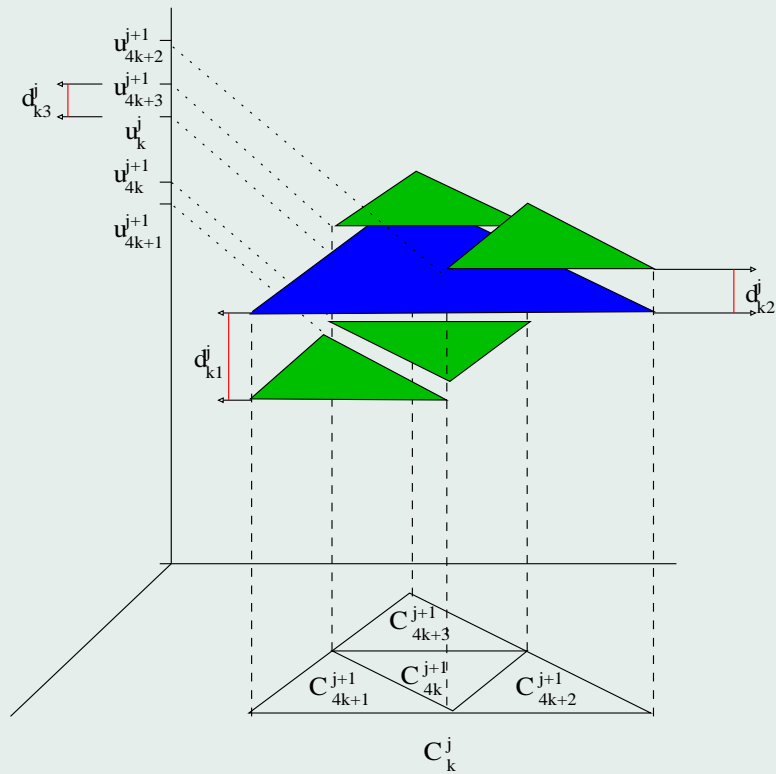

Jacobian matrices are estimated from the values of the solution in the previous time step. They have block-diagonal structure

Stability analysis: Does not depend on $p = 1, 2, 3$

$$\delta \geq \frac{10}{3} CFL^2 - \frac{2}{3} CFL + \frac{1}{10} \text{ linear advection eq.}$$

Adaptive Strategy

- **Transient problem**

Given the numerical solution $\mathbf{u}(t^n, x)$ based on the adapted grid M^n

1. Compute one level of wavelet coefficients d_λ
2. If $|d_\lambda| > \epsilon$, the corresponding element and neighbors are refined
3. If $|d_\lambda| < \theta$ within an element, then it is coarsened.
4. The coarsest grid and highest level of refinement are established a priori

- **Stationary problem**

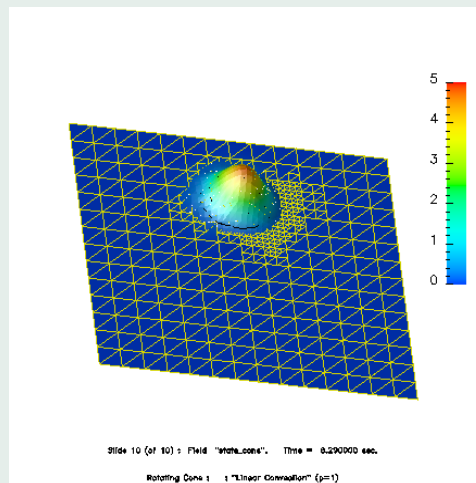

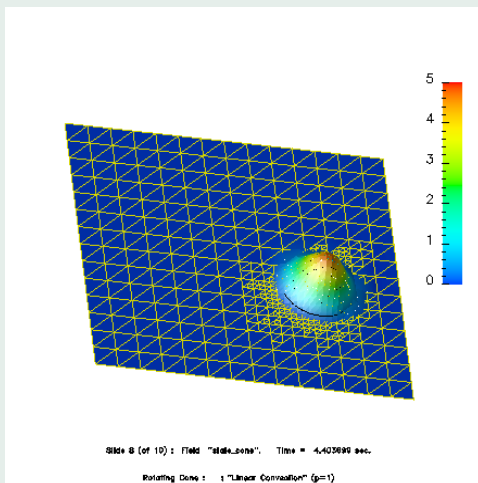

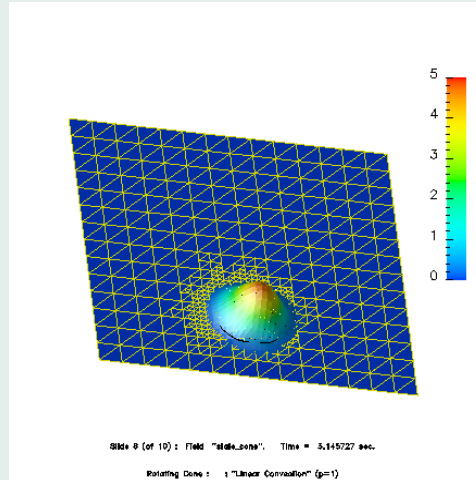

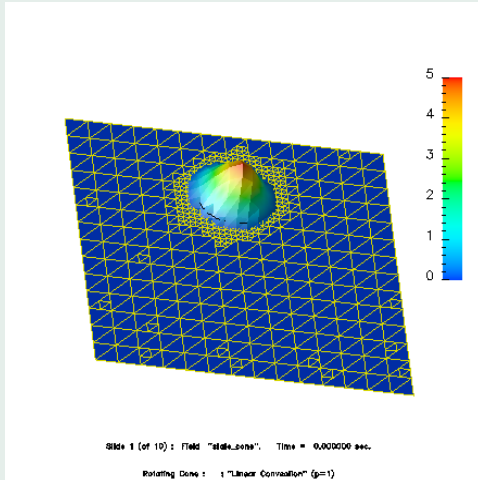

1. Consider the corresponding transient problem
2. Iterate on a given grid until iteration error is less than a prescribed parameter
3. Apply the wavelet-based refinement strategy to update the grid and repeat the process

Conclusions

- Stabilization of a scheme that uses Euler in time and discontinuous Galerkin in space is obtained by the introduction of an implicit diffusive term
- Definition of an h -adaptive strategy that uses wavelet coefficients as regularity indicators
- Savings in memory and CPU time are illustrated for typical CFD test problems
- Implementation in a computational framework based on object oriented philosophy
