▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

• We shall take, as an alphabet A, a finite field  $\mathbb{F}$ .

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

- We shall take, as an alphabet A, a finite field  $\mathbb{F}$ .
- In this case,  $\mathbb{F}^n$  is an *n*-dimensional vector space over  $\mathbb{F}$ .

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

- We shall take, as an alphabet A, a finite field  $\mathbb{F}$ .
- In this case,  $\mathbb{F}^n$  is an *n*-dimensional vector space over  $\mathbb{F}$ .
- We shall take, as codes, subespaces of  $\mathbb{F}^n$  of dimensión m < n.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

- We shall take, as an alphabet A, a finite field  $\mathbb{F}$ .
- In this case,  $\mathbb{F}^n$  is an *n*-dimensional vector space over  $\mathbb{F}$ .
- We shall take, as codes, subespaces of  $\mathbb{F}^n$  of dimensión m < n.

A code C as above is called a **linear code** over  $\mathbb{F}$ .

If d the minimum distance of C, we shall call it a (n,m,d)-code.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

A linear code  $C \subset \mathbb{F}^n$  is called a **cyclic code** if for every vector  $(a_0, a_1, \ldots, a_{n-2}, a_{n-1})$  in the code, we have that also the vector  $(a_{n-1}, a_0, a_1, \ldots, a_{n-2})$  is in the code.

A linear code  $C \subset \mathbb{F}^n$  is called a **cyclic code** if for every vector  $(a_0, a_1, \ldots, a_{n-2}, a_{n-1})$  in the code, we have that also the vector  $(a_{n-1}, a_0, a_1, \ldots, a_{n-2})$  is in the code.

Notice that the definition implies that if  $(a_0, a_1, \ldots, a_{n-2}, a_{n-1})$  is in the code, then all the vectors obtained from this one by a cyclic permutation of its coordinates are also in the code.

Let

$$\mathcal{R}_n = \frac{\mathbb{F}[X]}{\langle X^n - 1 \rangle};$$

We shall denote by [f] the class of the polynomial  $f \in \mathbb{F}[X]$  in  $\mathcal{R}_n$ .

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

$$\mathcal{R}_n = \frac{\mathbb{F}[X]}{\langle X^n - 1 \rangle};$$

We shall denote by [f] the class of the polynomial  $f \in \mathbb{F}[X]$  in  $\mathcal{R}_n$ . The mapping:

$$\varphi: \mathbb{F}^n \to \frac{\mathbb{F}[X]}{\langle X^n - 1 \rangle}$$

 $(a_0, a_1, \ldots, a_{n-2}, a_{n-1}) \in \mathbb{F}[X] \qquad \mapsto \qquad [a_0 + a_1 X + \ldots + a_{n-2} X^{n-2} + a_{n-1} X^{n-1}].$ 

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬる

$$\mathcal{R}_n = \frac{\mathbb{F}[X]}{\langle X^n - 1 \rangle};$$

We shall denote by [f] the class of the polynomial  $f \in \mathbb{F}[X]$  in  $\mathcal{R}_n$ . The mapping:

$$\varphi: \mathbb{F}^n \to rac{\mathbb{F}[X]}{\langle X^n - 1 
angle}$$

 $(a_0, a_1, \ldots, a_{n-2}, a_{n-1}) \in \mathbb{F}[X] \qquad \mapsto \qquad [a_0 + a_1 X + \ldots + a_{n-2} X^{n-2} + a_{n-1} X^{n-1}].$ 

 $\varphi$  is an isomorphism of  $\mathbb{F}$ -vector spaces. Hence  $A \text{ code } \mathcal{C} \subset \mathbb{F}^n$  is cyclic if and only if  $\varphi(\mathcal{C})$  is an ideal of  $\mathcal{R}_n$ .

In the case when  $C_n = \langle a \mid a^n = 1 \rangle = \{1, a, a^2, \dots, a^{n-1}\}$  is a cyclic group of order *n*, and  $\mathbb{F}$  is a field, the elements of  $\mathbb{F}C_n$  are of the form:

$$\alpha = \alpha_0 + \alpha_1 \mathbf{a} + \alpha_2 \mathbf{a}^2 + \dots + \alpha_{n-1} \mathbf{a}^{n-1}$$

・ロト ・ 目 ・ ・ ヨト ・ ヨ ・ うへつ

In the case when  $C_n = \langle a \mid a^n = 1 \rangle = \{1, a, a^2, \dots, a^{n-1}\}$  is a cyclic group of order *n*, and  $\mathbb{F}$  is a field, the elements of  $\mathbb{F}C_n$  are of the form:

$$\alpha = \alpha_0 + \alpha_1 \mathbf{a} + \alpha_2 \mathbf{a}^2 + \dots + \alpha_{n-1} \mathbf{a}^{n-1}.$$

It is easy to show that

$$\mathbb{F}C_n \cong \mathcal{R}_n = \frac{\mathbb{F}[X]}{\langle X^n - 1 \rangle};$$

In the case when  $C_n = \langle a \mid a^n = 1 \rangle = \{1, a, a^2, \dots, a^{n-1}\}$  is a cyclic group of order *n*, and  $\mathbb{F}$  is a field, the elements of  $\mathbb{F}C_n$  are of the form:

$$\alpha = \alpha_0 + \alpha_1 \mathbf{a} + \alpha_2 \mathbf{a}^2 + \dots + \alpha_{n-1} \mathbf{a}^{n-1}$$

It is easy to show that

$$\mathbb{F}C_n \cong \mathcal{R}_n = rac{\mathbb{F}[X]}{\langle X^n - 1 \rangle};$$

Hence, to study cyclic codes is equivalent to study ideals of a group algebra of the form  $\mathbb{F}C_n$ .

## **Group Codes**

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

A group code is an ideal of a finite group algebra.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

A group code is an ideal of a finite group algebra.

In what follows, we shall always assume that  $char(K) \nmid |G|$  so all group algebras considered here will be semisimple and thus, all ideals of  $\mathbb{F}G$  are of the form  $I = \mathbb{F}Ge$ , where  $e \in \mathbb{F}G$  is an idempotent element.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Let *H* be a subgroup of a finite group *G* and let  $\mathbb{F}$  be a field such that  $car(\mathbb{F}) \nmid |G|$ . The element

$$\widehat{\mathcal{H}} = \frac{1}{|\mathcal{H}|} \sum_{h \in \mathcal{H}} h$$

is an idempotent of the group algebra  $\mathbb{F}G$ , called the **idempotent** determined by H.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Let *H* be a subgroup of a finite group *G* and let  $\mathbb{F}$  be a field such that  $car(\mathbb{F}) \nmid |G|$ . The element

$$\widehat{H} = \frac{1}{|H|} \sum_{h \in H} h$$

is an idempotent of the group algebra  $\mathbb{F}G$ , called the **idempotent** determined by H.

 $\widehat{H}$  is central if and only if H is normal in G.

## **Essential idempotents**

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Let *e* be a primitive central idempotent of  $\mathbb{F}G$ . Then:

• If e is not a constituent of  $\widehat{H}$  we have that  $e\widehat{H} = 0$ .

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

Let e be a primitive central idempotent of  $\mathbb{F}G$ . Then:

- If e is not a constituent of  $\widehat{H}$  we have that  $e\widehat{H} = 0$ .
- If e is a constituent of  $\widehat{H}$  we have that  $e\widehat{H} = e$ .

Let e be a primitive central idempotent of  $\mathbb{F}G$ . Then:

- If e is not a constituent of  $\widehat{H}$  we have that  $e\widehat{H} = 0$ .
- If e is a constituent of  $\widehat{H}$  we have that  $e\widehat{H} = e$ .

In this last case, we have that  $\mathbb{F}G \cdot e \subset \mathbb{F}G \cdot \widehat{H}$ .

Denote by T a transversal of H in G. Then, an element  $\alpha \in \mathbb{F}G \cdot e$  can be written in the form

$$\alpha = \sum_{\nu \in T} \alpha_{\nu} \nu \hat{H}.$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Denote by T a transversal of H in G. Then, an element  $\alpha \in \mathbb{F}G \cdot e$  can be written in the form

$$\alpha = \sum_{\nu \in T} \alpha_{\nu} \nu \hat{H}.$$

If we denote  $T = \{t_1, t_2, \dots, t_d\}$  and  $H = \{h_1, h_2, \dots, h_m\}$ , the explicit expression of  $\alpha$  is

 $\alpha = \alpha_1 t_1 h_1 + \alpha_2 t_2 h_1 + \dots + \alpha_d t_d h_1 + \dots + \alpha_1 t_1 h_m + \alpha_2 t_2 h_m + \dots + \alpha_d t_d h_m.$ 

Denote by T a transversal of H in G. Then, an element  $\alpha \in \mathbb{F}G \cdot e$  can be written in the form

$$\alpha = \sum_{\nu \in T} \alpha_{\nu} \nu \hat{H}.$$

If we denote  $T = \{t_1, t_2, \dots, t_d\}$  and  $H = \{h_1, h_2, \dots, h_m\}$ , the explicit expression of  $\alpha$  is

$$\alpha = \alpha_1 t_1 h_1 + \alpha_2 t_2 h_1 + \dots + \alpha_d t_d h_1 + \dots + \alpha_1 t_1 h_m + \alpha_2 t_2 h_m + \dots + \alpha_d t_d h_m.$$

The sequence of coefficients of  $\alpha$ , when written in this order, is formed by *d* repetitions of the subsequence  $\alpha_1, \alpha_2, \dots \alpha_d$ . In terms of coding theory, this means that the code given by the minimal ideal  $\mathbb{F}Ge$  is a **repetition code**. We shall be interested in idempotents that are not of this type.

A primitive idempotent e in the group algebra  $\mathbb{F}G$ , is an **essential idempotent** if  $e \cdot \hat{H} = 0$ , for every subgroup  $H \neq (1)$  in G.

A minimal ideal of  $\mathbb{F}G$  will be called **essential ideal** if it is generated by an essential idempotent.

A primitive idempotent e in the group algebra  $\mathbb{F}G$ , is an **essential idempotent** if  $e \cdot \hat{H} = 0$ , for every subgroup  $H \neq (1)$  in G.

A minimal ideal of  $\mathbb{F}G$  will be called **essential ideal** if it is generated by an essential idempotent.

#### Lemma

Let  $e \in \mathbb{F}G$  be a primitive central idempotent. Then e is essential if and only if the map  $\pi : G \to Ge$ , is a group isomorphism.

A primitive idempotent e in the group algebra  $\mathbb{F}G$ , is an **essential idempotent** if  $e \cdot \hat{H} = 0$ , for every subgroup  $H \neq (1)$  in G.

A minimal ideal of  $\mathbb{F}G$  will be called **essential ideal** if it is generated by an essential idempotent.

#### Lemma

Let  $e \in \mathbb{F}G$  be a primitive central idempotent. Then e is essential if and only if the map  $\pi : G \to Ge$ , is a group isomorphism.

## Corollary

If G is abelian and  $\mathbb{F}G$  contains an essential idempotent, then G is cyclic.

Assume that G is cyclic of order  $n = p_1^{n_1} \cdots p_t^{n_t}$ . Then, G can be written as a direct product  $G = C_1 \times \cdots \times C_t$ , where  $C_i$  is cyclic, of order  $p_i^{n_i}$ ,  $1 \le i \le t$ .

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Assume that G is cyclic of order  $n = p_1^{n_1} \cdots p_t^{n_t}$ . Then, G can be written as a direct product  $G = C_1 \times \cdots \times C_t$ , where  $C_i$  is cyclic, of order  $p_i^{n_i}$ ,  $1 \le i \le t$ . Let  $K_i$  be the minimal subgroup of  $C_i$ ; i.e. the unique subgroup of order  $p_i$  in  $C_i$  and denote by  $a_i$  a generator of this subgroup,  $1 \le i \le t$ . Set

$$\mathsf{e}_0 = (1 - \widehat{\mathcal{K}_1}) \cdots (1 - \widehat{\mathcal{K}_t})$$

(i) If e is an essential idempotent, then the dimension of  $\mathbb{F}_q C \cdot e$  is precisely m.

(*ii*)  $dim(\mathbb{F}_q C_n)e_0 = \varphi(n)$  where  $\varphi$  denotes Euler's Totient function.

Let  $\mathbb{F}_q$  denote a finite field with q elements,  $C = C_n$  the cyclic of order n, with generator g such that (q, n) = 1. Let m be the multiplicative order of  $\overline{q}$  in the unit group  $U(\mathbb{Z}_n)$ . Then

(i) If e is an essential idempotent, then the dimension of  $\mathbb{F}_q C \cdot e$  is precisely m.

(*ii*)  $dim(\mathbb{F}_q C_n)e_0 = \varphi(n)$  where  $\varphi$  denotes Euler's Totient function.

(*iii*) There exist precisely  $\varphi(n)/m$  essential idempotents in  $\mathbb{F}_q C$ .

# Definition (Sabin and Lomonaco (1995))

Let  $G_1$  and  $G_2$  denote two finite groups of the same order and let  $\mathbb{F}$  be a field. Two ideals (codes)  $l_1 \subset \mathbb{F}G_1$  and  $l_2 \subset \mathbb{F}G_2$  are said to be **combinatorially equivalent** if there exists a bijection  $\gamma : G_1 \to G_2$  whose linear extension  $\overline{\gamma} : \mathbb{F}G_1 \to \mathbb{F}G_2$  is such that  $\overline{\gamma}(l_1) = l_2$ . The map  $\overline{\gamma}$  is called a **combinatorial equivalence** between  $l_1$  and  $l_2$ .

# Definition (Sabin and Lomonaco (1995))

Let  $G_1$  and  $G_2$  denote two finite groups of the same order and let  $\mathbb{F}$  be a field. Two ideals (codes)  $I_1 \subset \mathbb{F}G_1$  and  $I_2 \subset \mathbb{F}G_2$  are said to be **combinatorially equivalent** if there exists a bijection  $\gamma : G_1 \to G_2$  whose linear extension  $\overline{\gamma} : \mathbb{F}G_1 \to \mathbb{F}G_2$  is such that  $\overline{\gamma}(I_1) = I_2$ . The map  $\overline{\gamma}$  is called a **combinatorial equivalence** between  $I_1$  and  $I_2$ .

# Theorem (Chalom, Ferraz and PM (2017))

Every minimal ideal in the group algebra of a finite abelian group is combinatorially equivalent to a minimal ideal in the group algebra of a cyclic group of the same order. Recall that a binary linear code of dimension k and length n is called **simplex** if a generating matrix for the code contains all possible non zero columns of length k. Since these are  $2^k - 1$  in number, this matrix must be of size  $k \times (2^k - 1)$  so, we must have  $n = 2^k - 1$ .

Recall that a binary linear code of dimension k and length n is called **simplex** if a generating matrix for the code contains all possible non zero columns of length k. Since these are  $2^k - 1$  in number, this matrix must be of size  $k \times (2^k - 1)$  so, we must have  $n = 2^k - 1$ .

# Theorem (Chalom, Ferraz and PM (2017))

Let C be a binary linear code of dimension k and length  $n = 2^k - 1$ . Then C is a simplex code if and only if it is essencial.

Let  $C = \{v_1, \ldots, v_m\}$  be a linear code, whose elements we write as  $v_i = (v_{i,1}, v_{i,2}, \ldots, v_{i,n}), 1 \le i \le k - 1, 1 \le i \le k - 1$ . We say that C contains no zero column if, for each index  $j, 1 \le j \le n$ , there exists at least one vector  $v_i \in C$  such that  $v_{i,j} \ne 0$ .

Let  $C = \{v_1, \ldots, v_m\}$  be a linear code, whose elements we write as  $v_i = (v_{i,1}, v_{i,2}, \ldots, v_{i,n}), 1 \le i \le k - 1, 1 \le i \le k - 1$ . We say that C contains no zero column if, for each index  $j, 1 \le j \le n$ , there exists at least one vector  $v_i \in C$  such that  $v_{i,j} \ne 0$ .

## Theorem (Chalom, Ferraz and PM (2018))

Let C be a binary linear code of constant weight, without zero columns. Then C is equivalent to a cyclic code which is either essencial or a repetition code of an essencial one.

# **Twisted Group Algebra**

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

## Definition

Let *G* be a group and *R* a commutative ring whose set of invertible elements we denote by U(R). Consider a set of symbols  $\overline{G} = \{\overline{g} \mid g \in G\}$ . The **twisted group algebra** of *G* over *R* with twisting *t*, denoted  $R^tG$ , is the set of finite sums

$$R^t G = \left\{ \sum_{g \in G} a_g \overline{g} \mid a_g \in R \right\}$$

where addition is defined componentwise and multiplication is given by the following rules

## Definition

Let *G* be a group and *R* a commutative ring whose set of invertible elements we denote by U(R). Consider a set of symbols  $\overline{G} = \{\overline{g} \mid g \in G\}$ . The **twisted group algebra** of *G* over *R* with twisting *t*, denoted  $R^tG$ , is the set of finite sums

$$R^tG = \left\{\sum_{g\in G} a_g\overline{g} \mid a_g \in R\right\}$$

where addition is defined componentwise and multiplication is given by the following rules

$$ar{x}.ar{y} = t(x,y)\overline{xy}$$
 for all  $x, y \in G$ ,  
 $ar{x}a = aar{x}$  for all  $x \in G$  and  $a \in R$ ,

extended linearly.

## Definition

Let *G* be a group and *R* a commutative ring whose set of invertible elements we denote by U(R). Consider a set of symbols  $\overline{G} = \{\overline{g} \mid g \in G\}$ . The **twisted group algebra** of *G* over *R* with twisting *t*, denoted  $R^tG$ , is the set of finite sums

$$R^t G = \left\{ \sum_{g \in G} a_g \overline{g} \mid a_g \in R \right\}$$

where addition is defined componentwise and multiplication is given by the following rules

$$ar{x}.ar{y} = t(x,y)\overline{xy}$$
 for all  $x, y \in G$ ,  
 $ar{x}a = aar{x}$  for all  $x \in G$  and  $a \in R$ ,

extended linearly. Here, the map  $t : G \times G \rightarrow U(R)$  is called a **twisting** or a **factor set** if, for  $x, y, z \in G$  we have that

$$t(g,h).t(gh,\ell) = t(h,\ell).t(g,h\ell).$$

. . .

There is a close connection between factor sets and 2-cocycles as used in cohomology, actually both concepts coincide (see, for example Lectures in Abstract Algebra - Jacobson).

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

There is a close connection between factor sets and 2-cocycles as used in cohomology, actually both concepts coincide (see, for example Lectures in Abstract Algebra - Jacobson). Several results in this area can be proved via cohomological concepts but presently we shall use only classical ring theory.

There is a close connection between factor sets and 2-cocycles as used in cohomology, actually both concepts coincide (see, for example Lectures in Abstract Algebra - Jacobson). Several results in this area can be proved via cohomological concepts but presently we shall use only classical ring theory.

We begin with a very special example of twisting.

There is a close connection between factor sets and 2-cocycles as used in cohomology, actually both concepts coincide (see, for example Lectures in Abstract Algebra - Jacobson). Several results in this area can be proved via cohomological concepts but presently we shall use only classical ring theory.

We begin with a very special example of twisting.

Let  $C = \langle g \rangle$  be a cyclic group of order *n* and let  $\lambda$  be an invertible element in *R*. Then, the map  $t_{\lambda} : C \times C \rightarrow U(R)$  given by

$$t_{\lambda}(g^{i},g^{j}) = \begin{cases} 1 & \text{if } i+j < n, \\ \lambda & \text{if } i+j \ge n. \end{cases}$$

is a twisting.

Let  $C = \langle g \rangle$  be a cyclic group of order *n* and let  $R^t C$  be its twisted group algebra over a commutative ring *R*. Set

$$\lambda = \prod_{\ell=1}^{n-1} t(g, g^{\ell}).$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Then  $R^t C \cong R^{t_\lambda} C$  where  $t_\lambda$  is as above.

Let  $C = \langle g \rangle$  be a cyclic group of order *n* and let  $R^t C$  be its twisted group algebra over a commutative ring *R*. Set

$$\lambda = \prod_{\ell=1}^{n-1} t(g, g^\ell).$$

Then  $R^t C \cong R^{t_\lambda} C$  where  $t_\lambda$  is as above.

The proof actually shows that  $R^t C$  and  $R^{t_{\lambda}} C$  are the same as sets, with the same operations, though constructed from different bases.

Let  $C = \langle g \rangle$  be a cyclic group of order *n* and let  $R^t C$  be its twisted group algebra over a commutative ring *R*. Set

#### Corollary

The twisted group algebra of a cyclic group over a commutative ring is commutative.

Twistings for Abelian groups can be studied in a similar way.

(ロ)、(型)、(E)、(E)、 E) の(()

Twistings for Abelian groups can be studied in a similar way.

Given a finite Abelian group A, written as a direct product  $A = C_{m_1} \times \cdots \times C_{m_s}$ , where  $C_{m_i} = \langle g_i \rangle$  is cyclic of order  $m_i$ , and invertible elements  $\lambda_i \in R$ ,  $1 \le i \le s$ , set

$$t_{\lambda_i}(g_i^j, g_i^k) = egin{cases} 1, & ext{for } j+k < m_i, \ \lambda_i, & ext{for } j+k \geq m_i, \end{cases}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

which is a twisting of  $C_{m_i} = \langle g_i \rangle$  over R.

Twistings for Abelian groups can be studied in a similar way.

Given a finite Abelian group A, written as a direct product  $A = C_{m_1} \times \cdots \times C_{m_s}$ , where  $C_{m_i} = \langle g_i \rangle$  is cyclic of order  $m_i$ , and invertible elements  $\lambda_i \in R$ ,  $1 \le i \le s$ , set

$$t_{\lambda_i}(g_i^j, g_i^k) = egin{cases} 1, & ext{ for } j+k < m_i, \ \lambda_i, & ext{ for } j+k \geq m_i, \end{cases}$$

which is a twisting of  $C_{m_i} = \langle g_i \rangle$  over R.

We denote by  $t_{\Lambda}$  the twisting of A defined as follows. Given  $a = g_1^{i_1} \cdots g_s^{i_s}, \ b = g_1^{j_1} \cdots g_s^{j_s} \in A$  we set:

$$t_{\Lambda}(a,b) = t_{\Lambda}(g_1^{i_1}\cdots g_s^{i_s}, g_1^{j_1}\cdots g_s^{j_s}) = \prod_{k=1}^s t_{\lambda_k}(g_k^{i_k}, g_k^{j_k}).$$

where  $\Lambda = (\lambda_1, \ldots, \lambda_s)$ .

## Proposition

Let t be a twisting of A over  $\mathbb{F}$  such that  $R^{t}A$  is commutative. Then,  $R^{t}A \cong R^{t_{\Lambda}}A$  for some twisting  $t_{\Lambda}$  as defined above. Conversely, a twisted group algebra of the form  $R^{t_{\Lambda}}A$  is commutative.

We wish to study subgroup idempotents as in group algebras; however their definition needs to be modified to adapt it to products with a twisting.

## Proposition

Let  $C = \langle g \rangle$  be a cyclic group of order n and  $t = t_{\lambda}$ , with  $\lambda$  in a field  $\mathbb{F}$ , a twisting of C over  $\mathbb{F}$ . Given a root  $\alpha \in \mathbb{K}$ ,  $X^n - \lambda$  where  $\mathbb{K}$  denotes the splitting field of  $X^n - \lambda$ , we set

$$\widehat{C}_{\alpha} = \frac{1}{n} \sum_{j=0}^{n-1} \alpha^{-j} \overline{g}^j.$$

Then,  $\widehat{C}_{\alpha}$  is an idempotent of the twisted group algebra  $\mathbb{F}^{t_{\lambda}}C$ .

We wish to study subgroup idempotents as in group algebras; however their definition needs to be modified to adapt it to products with a twisting.

As before, this result can be extended to finite Abelian groups.

Let A be a finite Abelian group written as a direct product  $A = C_{m_1} \times \cdots \times C_{m_s}$ , where  $C_{m_i} = \langle g_i \rangle$  is cyclic of order  $m_i$ , and  $\mathbb{F}$ a finite field. Assume that the twisted group algebra  $\mathbb{F}^t A$  is endowed with a twisting  $t_A$  as defined above, with  $\lambda_i \in F$ ,  $1 \le i \le s$ . Let  $\mathbb{K}$  be the splitting field of the polynomial  $f = \prod_{i=1}^t (X^{m_i} - \lambda_i)$ , and let  $\mathcal{R}_i = \{\alpha_{ij} \mid 1 \le j \le m_i\}$  be the set of all roots of the polynomial  $X^{m_i} - \lambda_i$ ,  $1 \le i \le m_i$  in  $\mathbb{K}$ . For each subset of roots  $\alpha = (\alpha_{1i_1}, \ldots, \alpha_{si_s}) \in \mathcal{R}$ , we set:

$$e_{\alpha} = \widehat{(\mathcal{C}_{m_1})}_{\alpha_{1j_1}} \cdots \widehat{(\mathcal{C}_{m_s})}_{\alpha_{sj_s}},$$

Then

$$\{\mathbf{e}_{\alpha} \mid \alpha \in \mathcal{R}\}$$
